

Escherichia coli O antigen Grouping**Method:**

1. Biochemical identified pure culture of *E. coli* strain streaked out on any non-selective media e.g.
 - sheep blood agar
 - beef agar
 - nutrient agar
 - horse blood agarand incubated overnight at 37°C.
2. A) One smooth colony of the culture will be inoculated in enrichment broth (e. g. BHI, beef broth) and incubated overnight at 37°C.
or
B) Plating on non-selective (see 1. above) agar overnight at 37°C. Scrape off the *E. coli* colonies and suspend the bacteria in 2 ml of distilled or de-ionised water.
3. After incubation, the broth (A) or suspension (B) will be heated at ≥90°C for 1 hour.
4. Preparation of ready-to-use O antigen suspension for O grouping in microtiterplates (MTP):
 - A) The broth (=ready-to-use O antigen suspension) after cooling to room temperature (Note: LEP dilutes this broth 1/2 with formol saline to give the ready-to-use O antigen suspension).
or
B) The boiled suspension from 3. B) is added drop-wise (about 0.2 ml) to a tube containing 5 ml of normal saline until a concentration corresponding to an overnight broth culture is reached, which is estimated by the eye. The remaining boiled suspension is stored refrigerated and used to

Appendix 1

O Grouping: Standard Operation Procedure (O SOP)

prepare a ready-to-use O antigen suspension in distilled or de-ionised water if the strain is O rough in normal saline.

Screening:

5. A minimum of 25 µl of the ready-to-use O antigen suspension and an equal volume of
 - A) Pooled O antisera (O pools according to WHO Reference Laboratory)
or
 - B) single O antisera (full range)

is added to the MTP

6. The MTP is incubated in a humid atmosphere at 50-52 °C overnight.
7. Reading of results.

Ranging from - or + not significant
 to
 ++ or +++ significant

Presumptive typing:

8. A minimum of 25 µl of the ready-to-use O antigen suspension and an equal volume of

Appendix 1

O Grouping: Standard Operation Procedure (O SOP)

single O antisera of respective pool is added in a new MTP and incubated again at 50-52 °C overnight.

9. Reading of results of single O antisera from respective O pool (see 7.)

Appendix 1

O Grouping: Standard Operation Procedure (O SOP)

Definitive typing:

10. A minimum of 25 µl of the ready-to-use O antigen suspension and an equal volume of the reacting O group mono-specific or non-absorbed O antiserum is titrated using doubling dilutions, including negative control in normal saline.

Negative strains:

If strains are negative in either O pools or O single antisera during screening (5-7.), a fresh broth (2.A) or suspension (2. B) is made and autoclaved at 122°C for 90 minutes and used as the ready-to-use O antigen suspension.

O rough strains:

Use the other (non-saline) half of the ready-to-use O antigen suspension from 4. B) or produce fresh suspension from non-selective medium in distilled water as in 2.B) - 4. B).

11. Report.

Escherichia coli H antigen Determination

Method:**Production of motile *E. coli***

- The same colony as is used for *Escherichia coli* O antigen Grouping, see 2.) is inoculated from non-selective agar to
 - one side of U-tubes with semi-solid agar
 - swarming agar plates
 - tubes with semi-solid agar
 - Craigie tubes with semi-solid agar
- The tubes or plates are incubated at 30°C or 37°C
 - motile strains which show migration through the tubes, should get another passage in a second tube to obtain the optimal formation of H antigen
 - strains which show no swarming or migration through tubes for 2 weeks are defined as non-motile

Appendix 2

H Determination: Standard Operation Procedure (H SOP)

Ready-to-use preparation of H antigens

- A) A small amount of tube culture from the migration zone is transferred to any of the following:
 - overnight broth culture as stand-culture (30°C)
 - roller incubation of broth culture for 6-8 hours (37°C)
 - broth culture for 6 hours (30°C)
- or
- B) From swarming agar plates:
 - Suspend growth from an actively swarming semi-solid agar plate in broth corresponding to an overnight incubation
- Formalin is added to the broth culture to a final concentration of 0.5% resulting in the ready-to-use preparation of H antigen

Screening:

- A minimum of 25 µl of the ready-to-use preparation of H antigen and an equal volume of
 - A) Pooled H antisera (H pools according to WHO Reference Laboratory)
 - or
 - B) single H antisera (full range)

is added to the MTP

Appendix 2

H Determination: Standard Operation Procedure (H SOP)

- The MTP is incubated in a humid atmosphere at 50-52 °C for one-and-a-half to two (maximum!) hours.

- Reading of results.

Ranging from - or + not significant
 to
 ++ or +++ significant

Presumptive typing:

- A minimum of 25 µl of single H antisera of respective H pool and an equal volume of the ready-to-use H antigen preparation is added in a new MTP and incubated a humid atmosphere at 50-52 °C for one-and-a-half to two (maximum!) hours.
- Reading of results of single antisera from respective pool (see 7.)

Definitive typing:

- A minimum of 25 µl of the ready-to-use H antigen preparation and an equal volume of the reacting H group mono-specific or non-absorbed H antiserum is titrated using doubling dilutions, including negative control with normal saline. Incubation in a humid atmosphere at 50-52 °C for one-and-a-half to two (maximum!) hours.
- Report.

Appendix 2

H Determination: Standard Operation Procedure (H SOP)

D) Special procedures:

- “H rough” cultures are sub-cultured in semi-solid media and incubated again in broth + 1% glucose at room temperature in the dark overnight. Formalin is added to the broth culture to a final concentration of 0.5% resulting in the new ready-to-use H antigen preparation and typed from **Screening 5**.
- Non-typeable strains are passaged several times (up to three months once to thrice a week) in semi-solid medium. Most motile strains will eventually become typeable. If not, refer to reference laboratory or try *fliC* typing.
