

Take part in the national EFTER-COVID survey

Along with more than 1 million others, you are invited to help map the health of the population during and after the COVID-19 pandemic. The survey focuses on long-term effects of having COVID-19, but your answers are equally important whether you've had COVID-19 or not. It takes about 10 minutes to answer the questionnaire.

Dear «Fornavn» «Efternavn»,

About a week ago, we sent you an invitation to take part in the EFTER-COVID study, a large nationwide survey conducted by the Statens Serum Institut in collaboration with experts from hospitals and universities.

We haven't yet received your response, but we very much hope that you are able and willing to participate, even if you haven't been sick or infected. Your responses help to create new and valuable knowledge about the health of the population and long-term effects of COVID-19.

How to complete the EFTER-COVID questionnaire

Return to the Danish letter in your E-boks and click on the link "[Åben spørgeskema](#)" to access the questionnaire.

Once you are on the first page of the questionnaire you can switch to the English version by clicking the "EN" button at the bottom of the page.

It takes 5–15 minutes to complete the form, depending on how many symptoms you have had.

The questionnaire can also be accessed by going to www.survey-xact.dk/collect
Enter your 12 digit password in the field "Nøgle".

If you need to pause and come back to the questionnaire, you can resume answering where you left off.

We hope that you will participate and by doing so contribute to new knowledge about the health of the population and the long-term effects of COVID-19.

Many thanks in advance for your help. Yours sincerely,

Tyra Grove Krause
Head of Department, Infectious Disease Epidemiology & Prevention
Statens Serum Institut
